## **Database Design Guide**

This guide will help the student to create a database on the Hotel Rooms Management System. It will help to manage the below functionalities.

- Hotel
- Customer
- Employee
- Rooms
- Payment
- Booking
- Review

We will use MySQL as the DBMS to create the database and its related operations.

## 1. Introduction to MySQL

MySQL is an open-source relational database management system (RDBMS) that uses structured query language (SQL) to manage and manipulate data in a database. It is widely used for various applications, from small web applications to large enterprise systems.

MySQL's key features include:

- Scalability: Capable of handling large amounts of data and concurrent connections.
- Flexibility: Supports various data types and storage engines.
- · Performance: Optimized for speed and efficiency.
- Reliability: Known for its stability and robustness.

#### 2. Installation of MySQL

MySQL can be installed on various operating systems, including Windows, macOS, and Linux. Here are the general steps to install MySQL:

### Windows:

- Download the MySQL installer from the official website. https://dev.mysgl.com/downloads/installer/
- Run the installer and follow the on-screen instructions.
- Choose the installation type (Typical, Complete, or Custom). Recommended Custom.
- Set a root password for the MySQL server.

#### 3. E-R Diagram (ERD)

An Entity-Relationship Diagram (ERD) is a visual representation of the data model that shows the entities, attributes, relationships between entities, and cardinality. ERDs are commonly used in database design to help developers and stakeholders understand the structure and relationships within a database.

#### **Identify Entities**

- Start by identifying the main entities in your system. These are the objects or concepts about which you want to store data.
- Each entity should correspond to a table in your database.

#### **Define Attributes**

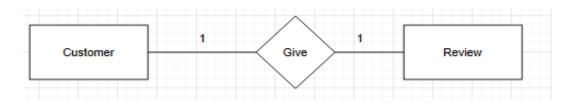

- For each entity, list the attributes (properties or fields) that describe it.
- These attributes will become columns in the corresponding database table.

## **Identify Relationships**

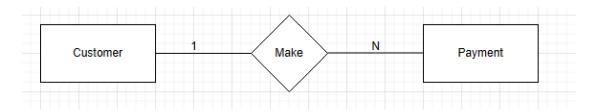

- Determine how entities are related to each other. There are three types of relationships: one-to-one (1:1), one-to-many (1:N), and many-to-many (N:M).
- Represent these relationships using lines connecting the entities.

Let's see a few examples of relationships:

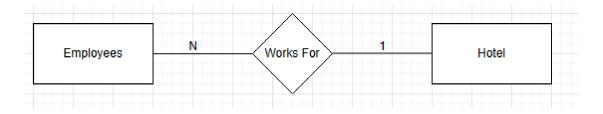

#### One to One

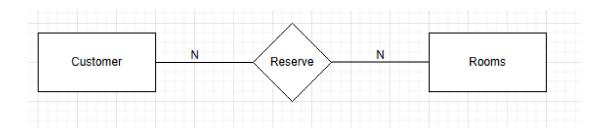

## One to Many

## Many to One

## **Many to Many**

## **Cardinality Notation**

Cardinality represents the number of times an entity of an entity set participates in a relationship set. Or we can say that the cardinality of a relationship is the number of tuples (rows) in a relationship.

- Use notation (such as Crow's Foot Notation or Chen Notation) to indicate the cardinality of each relationship.
- Cardinality describes how many instances of one entity are related to how many instances of another entity.
- Common notations include:
  - One (1)
  - Zero or one (0..1)
  - Many (N)
  - Zero or many (0..N)

#### **Optional:**

#### **Add Attributes and Constraints**

• Include additional information in your ERD, such as primary keys, foreign keys, and constraints (e.g., unique constraints).

#### **Create the Diagram**

• Use specialized diagramming software or tools (e.g., Lucidchart, draw.io, or even pen and paper) to create your ERD.

#### Refine and Review:

 Review your ERD with stakeholders and team members to ensure it accurately represents the data model and relationships. Make any necessary refinements.

Let's identify the entities of the Hotel Rooms Management System:

- Hotel
- Customer
- Employees
- Rooms
- Payment
- Bookings
- Review

\*\*\* Now let's identify the attributes and relationships of each entity for the Student Management System.

#### **Hotel**

Attributes:

HotelId(Primary Key)

HotelName

HotelAddress

HotelEmailId

HotelPhoneNo

Relationships:

One **Hotel** has Many **Customer** (**One-to-Many**)

One **Hotel** owns Many **Rooms** (**One-to-Many**)

#### Customer

Attributes:

custID (Primary Key)

custName

custPhoneNo

custAddress

custEmaild

Relationships:

Many Customer Check in or check out Many Rooms (Many-to-Many)

One **Customer** Check in or check out One **Rooms** (**One-to-One**)

#### Rooms

• Attributes:

roomId(Primary Key)

roomNo

roomType

roomPrice

status

hoteltId(Foreign Key)

Relationships:

One Customer has Many Rooms (One-to-Many)

Rooms Type:Classic,Deluxe

#### **Booking**

Attributes:

BookingId (Primary Key)

checkInDate

checkOutDate

totalAmount

custId(Foreign Key)

roomld(Foreign Key)

## Relationships:

Many Customer has many Booking (Many-to-Many)
One Customer has many Booking (One-to-Many)

## **Employee**

Attributes:

empID (Primary Key) empName empPhoneNo empAddress salary

Relationships:

Many Employee works for One Hotel (Many-to-one)

## <u>Payment</u>

Attributes:

PaymentId(Primary Key)
PaymentDate
PaymentMethodS
PaymentAmount
BookingId(Foreign key)

Relationships:

One **Customer** can make multiple **payment(One-to-Many)** 

#### Review

Attributes:

ReviewID (Primary Key) Rating ReviewDate Comment

bookingId(Foreign key)

Relationships:

One Customer can give Many Review(One-to-Many)

## **Table Structure**

## 1. Hotel

mysql> desc hotel_ashoka;							
Field	Туре	Null	Key	Default	Extra		
hotelId   hotelName   hotelEmailId   hotelPhoneNo   hotelAddress	int varchar(100) varchar(200) int varchar(200)	NO YES YES YES YES	PRI	NULL NULL NULL NULL NULL			
fows in set (0.01 sec)							

## 2. Customer

mysql> desc customer;							
Field   Type	Null	Key	Default	Extra			
custId   int   custName   varchar(50   custEmailId   varchar(50   custPhoneNo   int   custAddress   varchar(10	) YES YES	PRI	NULL NULL NULL NULL NULL				
+							

## 3. Rooms

```
mysql> desc rooms;
                              Null | Key | Default | Extra
 Field
             Type
 roomID
             int
                                     PRI
                                           NULL
                              NO
 hotelID
              int
                              YES
                                     MUL
                                           NULL
 roomNo
              int
                              YES
                                           NULL
 roomType
              varchar(50)
                              YES
                                           NULL
              decimal(10,2)
 roomPrice
                              YES
                                           NULL
             varchar(100)
                              YES
 status
                                           NULL
5 rows in set (0.01 sec)
```

# 4. Employees:

Field	Туре	Null	Key	Default	Extra
empID	int	NO	PRI	NULL	
empName	varchar(50)	NO	İ	NULL	i i
empAddrress	varchar(100)	NO	İ	NULL	i i
empEmail	varchar(100)	NO		NULL	i i
empPhone	varchar(20)	NO	İ	NULL	i i
Salary	decimal(10,2)	NO	İ	NULL	i i

# 5.Booking:

mysql> desc booking;								
Field	Туре	Null	Key	Default	Extra			
bookingId   custId   roomId   checkInDate   checkOutDate   totalAmount	int int int date date decimal(10,2)	NO YES YES YES YES YES	PRI   MUL   MUL	NULL NULL NULL NULL NULL				
+								

# 6.Payments:

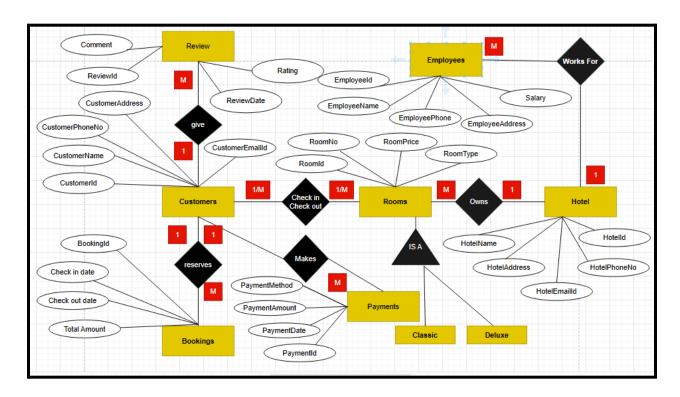

Field	Туре	Null	Key	Default	Extra
paymentID bookingId paymentAmount paymentDate paymentMethods	int   int   decimal(10,2)   date   varchar(100)	NO YES NO NO YES	PRI MUL	NULL NULL NULL NULL NULL	auto_increment     

#### 7.Reviews:

mysql> desc reviews;							
Field	Туре	Null	Key	Default	Extra		
ReviewId bookingId Rating Comment ReviewDate	int int int text date	NO YES NO YES NO	PRI MUL	NULL NULL NULL NULL NULL	auto_increment		
5 rows in set (0.01 sec)							

Now, let's create the ER diagram to visually represent the entities and relationships.

## **ERD Diagram**

### In this ERD:

- Guest can book multiple room and each room can have multiple bookings, creating a many-to-many relationship.
- The customer entity reserves as a bridge table between Customer and Rooms entities to represent this relationship.
- Multiple rooms can be booked by one customer (many-to-one relationship).
- Many employees works for one hotel (many-to-One relationship).
- · A customer can give multiple reviews.

Customer may have bookings of multiple rooms.

## 4. Creating a Database

Using MySQL server, create a new database for your hotel rooms management system. You can do this with SQL commands or through the graphical interface.

#### CREATE DATABASE HOTELS:

## 5. Using a Database

Before performing any operations on a database, you need to select it using the USE statement:

#### **USE HOTELS**;

## 6. Creating the tables for each entity

```
create database hotels:
use hotels;
create table Hotel ashoka(
hotelld INT primary KEY,
hotelName VARCHAR(100),
hotelEmailId varchar(200),
hotelPhoneNo int(10),
hotelAddress varchar(200)
CREATE TABLE Rooms (
  roomld INT PRIMARY KEY,
  hotelld INT,
  roomNo INT,
  roomType VARCHAR(50),
  roomPrice DECIMAL(10, 2),
  status VARCHAR(100);
  FOREIGN KEY (hotelld) REFERENCES Hotel ashoka(hotelld)
CREATE TABLE Customer (
  custld INT PRIMARY KEY,
  custName VARCHAR(50),
  custEmailId VARCHAR(50),
  custPhoneNo varchar(20),
  custAddress VARCHAR(100)
CREATE TABLE Booking (
  bookingld INT PRIMARY KEY,
  custId INT.
  roomld INT,
  checkInDate DATE.
  checkOutDate DATE,
  totalAmount DECIMAL(10, 2),
```

```
FOREIGN KEY (custId) REFERENCES Customer(custId),
  FOREIGN KEY (roomld) REFERENCES Rooms(roomld)
CREATE TABLE Payments (
  paymentID INT PRIMARY KEY,
  bookingId INT,
  paymentAmount DECIMAL(10, 2) NOT NULL,
  paymentDate DATE NOT NULL,
  paymentMethods varchar(100),
  FOREIGN KEY (bookingId) REFERENCES Booking(bookingId)
);
CREATE TABLE Employees (
  empID INT PRIMARY KEY,
  empName VARCHAR(50) NOT NULL,
  emp Address VARCHAR(100) NOT NULL,
  empEmail VARCHAR(100) NOT NULL,
  empPhone VARCHAR(20) NOT NULL,
  Salary DECIMAL(10, 2) NOT NULL
CREATE TABLE Reviews (
  Reviewld INT PRIMARY KEY,
  bookingld INT,
  Rating INT NOT NULL,
  Comment TEXT,
  ReviewDate DATE NOT NULL,
  FOREIGN KEY (bookingld) REFERENCES Booking(bookingld)
);
Auto-increment
ALTER TABLE Reviews modify Reviewld int auto increment;
ALTER TABLE booking bookingId int auto increment;
```

Add data to your tables to work with. This step helps you test your database.

664464, 'Ashoka\_hotel', 'ashokdhadi@gmail.com', 986789764, 'Mankhurd'

7. Insert records

-- Insert hotels:

);

INSERT INTO hotel Ashoka value(

```
-- Insert rooms
```

```
INSERT INTO rooms
(roomID,hoteIID,roomNo,roomType,roomPrice) VALUES
(10023,664464,101,'classis',2500.00),
(10024,664464,102,'classis',2500.00),
(10025,664464,103,'classis',2500.00),
(10026,664464,104,'deluxe',4000.00),
(10027,664464,105,'classis',2500.00),
(10028,664464,201,'deluxe',4000.00),
(10029,664464,202,'classis',2500.00),
(10030,664464,203,'deluxe',4000.00);
```

#### -- Enroll customer

**INSERT INTO customer** 

```
(custId,custName,custEmailId,custPhoneNo,custAddress) VALUES (40010,'priti singh','pritisingh89@gmail.com',897654345,'alibagh'), (40011,'vidhi kumar','vidhikumar43@gmail.com',789867543,'panvel'), (40012,'sara jadahv','sarajadhv@gmail.com',675645348,'kharghar'), (40013,'sagar yadhv','sagarjadhv45@gmail.com',986547868,'pune'), (40014,'suresh kamble','sureshkamble@gmail.com',778896503,'raigad'), (40015,'yogesh more','yogeshkamble@gmail.com',908796583,'pen'), (40016,'mayur patil','mayurpatil@gmail.com',976896430,'sagli');
```

## -- Insert employees

```
INSERT INTO employees (empID,empName,empAddrress,empEmail,empPhone,Salary) VALUES (5001,'ram kadam','vadala','ramkadam@gmail.com',642308976,20000), (5002,'sham lal','ghatkoper','shamlal@gmail.com',897896573,25000), (5003,'kishor patil','nerul','kishorpatil@gmail.com',787965478,25000), (5004,'anish jadhv','kurla','anishjadhv@gmail.com',897860087,20000), (5005,'sahil zage','chembur','sahilzage@gmail.com',677689055,20000), (5006,'vinayak sharma','juinagar','vinayaksharma12@gmail.com',998768964,25000);
```

## -- Insert booking

**INSERT INTO booking** 

(bookingId,custId,roomId,checkInDate,checkOutDate,totalAmount)VALUES (6001,40010,10023,'2023-12-01','2023-12-02',4000),

```
(6002,40011,10024,'2023-11-29','2023-11-30',4000),
(6003,40012,10025,'2023-11-26','2023-11-28',8000),
(6004,40013,10026,'2023-11-29','2023-12-01',10000);
```

#### -- Insert payments

```
INSERT INTO payments (paymentID,bookingId,paymentAmount,paymentDate,paymentMethods)VALUES (7001,6001,4000,'2023-12-01','cash'), (7002,6002,4000,'2023-11-29','online'), (7003,6003,8000,'2023-11-26','cash'), (7004,6004,10000,'2023-11-29','cash');
```

## -- Insert booking

INSERT INTO reviews(ReviewId,bookingId,Rating,Comment,ReviewDate)VALUES (8001,6001,5,'Great experience!','2023-12-02'), (8002,6002,5,'Excellent hotel and services!','2023-11-30'), (8003,6003,4,'Great experience!','2023-11-28'), (8004,6004,5,'Good experience!','2023-12-01')

#### 8. Select records

Write SQL queries to retrieve and manage data.

For example:

#### Retrieve all customer:

Select \* FROM customer;

#### Retrieve a customer booking:

```
select * from booking where custId=40010; select * from booking where custId=40012;
```

\*Now try similar Select queries with other tables

## 9. Update records

Write SQL statements to update record(s) when needed. For example:

## **Update a customer phoneNo and Emailld:**

## **UPDATE** customer

update customer set custPhoneNo=797654345 where custId=40010; update customer set custEmailId='mayurpatil@gmail.com' where custId=40016;

#### 10. Delete records

Write SQL statements to delete record(s) when needed.

DELETE FROM customer where custName='suresh kamble";

**PN:** Ideally no data should be deleted from any tables. You can use an additional column to set the status of that record to 'Active/Inactive', etc. Or you can use an Archive table to move the unnecessary records out of the main table.
